His vital signs remain stable, and there are no signs of infection or other complications. He has a history of hypertension and type 2 diabetes, both of which are well-managed.

During his stay, we encouraged early mobilization and provided wound care. The surgical site is healing well, with no signs of redness, swelling, or discharge. We have also begun patient education on activity restrictions and wound care at home.

Sample Response:

Dear Dr. Johnson,

Re: Mrs. Jane Smith, aged 65

I am writing to refer Mrs. Jane Smith, who has been under my care for the management of her diabetic foot ulcer. Mrs. Smith has a 10-day history of a painful ulcer on the plantar surface of her right foot. She has a known history of poorly controlled type 2 diabetes mellitus and peripheral neuropathy.

On examination, the ulcer measures approximately 2 cm in diameter, with surrounding erythema and mild swelling. The wound bed appears yellowish, indicating possible infection. Her vital signs are stable; however, her recent blood glucose readings have been consistently elevated, averaging 15 mmol/L.

In the past week, I have been dressing the wound with saline-soaked gauze and advising strict foot care. Antibiotics have not been initiated yet, pending assessment. She reports some increased pain and difficulty walking.

Given the severity of the ulcer and risk of progression, I recommend a specialist assessment for possible debridement and further vascular evaluation. Please advise on the next steps for management.
