- User Interface (UI)

The frontend interface, built with HTML, CSS, and JavaScript, presents an intuitive dashboard for

staff and administrators. It allows easy navigation through various functionalities such as new order entry, menu updates, or reports.

- Backend Logic

PHP scripts handle the core operations, processing user input, executing database queries, and managing business logic. This includes validating orders, updating inventories, and calculating totals.

- Database Layer

MySQL or MariaDB databases store all essential data, including menu items, customer information, order details, and inventory records. Proper database design ensures data integrity and rapid retrieval.

- Authentication & Security

Secure login systems restrict access to authorized personnel. Data encryption and validation prevent unauthorized access and potential security breaches.

Developing the System: Step-by-Step Process

Create an Entity-Relationship (ER) diagram to visualize data relationships. Typical tables include:

- `users` (admin, staff)

- `menu\_items` (pizza names, ingredients, prices)
- `orders` (order ID, customer info, timestamp)
- `order\_details` (items in each order)
- `customers` (name, contact info)
- `inventory` (ingredients, stock levels)
- `delivery` (driver info, delivery status)

- Developing the User Interface

Design forms for:

- Placing new orders
- Updating menu items
- Managing customer data
- Generating reports

Ensure the interface is user-friendly and responsive.

- Implementing Backend Logic

Write PHP scripts for:

- CRUD operations (Create, Read, Update, Delete)
- Order processing workflows
- Inventory management algorithms
- Payment calculations

Using PHP sessions ensures secure user authentication.

- Integrating Payment Systems

Incorporate payment gateways like PayPal or Stripe to facilitate online payments, enhancing convenience for customers.
